Protected Bicycle Lanes in NYC
Protected Bicycle Lane Analysis

Overview

Since 2007, the New York City Department of Transportation has installed over 30 miles of protected bicycle lanes throughout the city, including several parking protected bicycle lanes on various avenues in Manhattan. The following report contains an analysis of how some of these Manhattan routes have impacted safety, mobility, and economic vitality. Routes were chosen for inclusion if they had at least three years of “after” safety data available.

Safety

- Crashes with injuries have been reduced by 17%
- Pedestrian injuries are down by 22%
- Cyclist injuries show a minor decrease even as bicycle volumes have dramatically increased
- Total injuries have dropped by 20%
- 74% decrease in average risk of a serious injury to cyclists from 2001 to 2013
- Cyclist injury risk has generally decreased on protected bicycle lane corridors within this study as cyclist volumes rise and cyclist injuries decrease

Mobility

- Travel speeds in the Central Business District have remained steady as protected bicycle lanes are added to the roadway network
- Travel times on Columbus Avenue have improved while vehicle volumes are maintained
- First Avenue travel speeds remained level through project area
- Travel times on 8th Avenue improved by an average of 14%

Economic Vitality & Quality of Life

- When compared to similar corridors streets that received a protected bicycle lane saw a greater increase in retail sales
- 110 trees have been added to projects within this study area, enhancing the neighborhood through which they run
- Crossing distances along corridors have been shortened anywhere between 17’ and 30’

The following corridor analysis includes all portions of each corridor that received the protected bicycle lane treatment. Any portion of the corridor that did not receive the treatment was left out even if it received other upgrades at the same time. Analysis includes segments that have three years of after data.
Design of each protected bicycle lane looks similar but there are important distinctions when compared to “Before” condition

- Lane Removal (Y/N)
- Lane Narrowing (Y/N)
- Pre-Existing Basic or Buffered Bike Lane
- Remove or Curbside Rush Hour Vehicle Lane
- Major network change (Y/N)

Differences in Final Designs

- All Split-Phase Signals vs Primarily Mixing Zones
- Includes Bus Lane
- Concrete vs Painted Pedestrian Islands
Looking at all corridors combined with at least three years of after data, we find that:

- Crashes with injuries have been reduced by 17%
- Pedestrian injuries are down by 22%
- Cyclist injuries show a minor improvement even as bicycle volumes have dramatically increased
- Total injuries have dropped by 20%

Protected bicycle lane projects with 3 years of after data include the following: 9th Ave (16th-31st), 8th Ave (Bank-23rd, 23rd-34th), Broadway (59th-47th, 33rd-26th, 23rd-18th), 1st Avenue (Houston to 34th), 2nd Ave (Houston-34th), Columbus Ave (96th-77th) Note: Only sections of projects that included protected bicycle lanes were analyzed

NEW YORK CITY DEPARTMENT OF TRANSPORTATION
The **New York City Cycling Risk Indicator** is calculated as the number of bicyclists killed or severely injured in motor vehicle traffic crashes, divided by the **NYC In-Season Cycling Indicator**, multiplied by 100.

- 74% decrease in average risk of a serious injury to cyclists from 2001 to 2013

For volume and safety details for each of the above corridors see appendix

The cyclist risk measure was calculated as a relative rate of injury per cyclist during the 3-year before period and the 3-year after period. To generate the cyclist risk measure, the number of injuries recorded in the project area over the entire investigation period was normalized by the number of cyclists measured on the facility over a 12-hour period representative of April-October cycling conditions. The percent change of the cyclist risk measure between the before period and the after period provides the effect of the individual project on the cyclist risk of injury. See individual project slides in appendix for data sources.
2. Mobility – Central Business District

- Travel speeds in the Central Business District have remained steady as protected bicycle lanes are added to the roadway network.

Weekday Manhattan CBD Taxi Speeds
8:00a-6:00p

Between 2009 and 2012 Manhattan saw a 9% increase in private sector jobs, with increases projected to continue.

Note: CBD includes all projects in study except Columbus Avenue
Source: NYC TLC – Data includes all weekday yellow taxi trips from 8am-6pm taken in the Manhattan CBD (from Bowling Green to 59th St, river to river), excludes New Year’s Day, Memorial Day, Independence Day, Labor Day, Thanksgiving and Christmas.
Job Data Source: NYC Economic Development Corporation
2. Mobility – Columbus Avenue

- Travel times on Columbus Avenue have improved while vehicle volumes are maintained.

### Vehicle Volumes
(Columbus Ave, W 96 St to W 95 St)

3. Quality of Life

- 110 trees have been added to projects within this study area, enhancing the neighborhoods through which they run.

- Crossing distances shortened anywhere between 17’ and 30’
Protected Bicycle Lane Analysis

Design – 2nd Avenue (14th Street to 23rd Street)

The Evolution of a Parking Protected Bicycle Lane

Before: Four moving lanes, standard curbside bus lane

2010: Four moving lanes, curbside buffered bike lane, upgraded bus-only lane

2013: Three moving lanes, parking protected bicycle lane, refurbished bus lanes
Reduction of vehicle volumes as users apparently shifted to other modes allowed for the 2013 upgrade:

- AM vehicle volumes (-11.8%)
- PM vehicle volumes (-15.3%)
- M15 Bus Ridership (+9%)
- Bicycle Volumes (+60%)
Painted pedestrian safety islands provide flexibility for maintenance and constructability

Final Design Elements
• Parking protected
• Mixing zones
• Painted pedestrian safety islands
• Bus only red lanes
• Bus only overhead guide signs
